1.0 IMPORTANT NOTICE & INTRODUCTION & SAFETY NOTICE

IMPORTANT NOTICE

Please read before attempting service

1. While the monitor is in operation, do not attempt to connect or disconnect any wires.
2. Make sure the power cord is disconnected before replacing any parts in the monitor.
3. When the power is on, do not attempt to short any portion of the circuit. This shorting may cause damage to the transistors in the monitor.
4. When servicing the H.V. area, be certain that the C.R.T anode is safely discharged before removing the anode cap.
5. Caution must be exercised when servicing this monitor.

INTRODUCTION

Enhanced repair capabilities

This Service Manual is edited for model 1569VL when service is necessary. There are four primary parts included in this troubleshooting guide which offer the easiest way to locate problem points and repair the machine to the best possible condition.

1. The Adjustment section offers the adjustable method, steps and all data of the factory's initial settings which can make the machine get the best performance at that time. By the way, before adjusting, the machine must be warmed up for at least 10 minutes and the CRT face must be in an eastward direction.
2. The Troubleshooting section has four main parts including: power supply, power saving, CRT, deflection & video circuit. Each offers fast repair routine and the IC, transistor voltage records against all specified signal modes. These voltage readings are measured with a HP 34401A multimeter with input impedance 10M (0.1V/1000V range) and waveforms shown on circuit schematics are measured by a Tektronix TDS 520 digital

oscilloscope, the monitor receives VGA-480 full white square pattern.

3. The Spare parts list offers the CTX part number (P/N) which is used frequently by repairmen / technicians. For details please refer to the service guide or service manual. If there is any engineering change regarding this model, CTX will issue the updated information by a non-periodical Technical Bulletin.
4. The transistor voltage records are measured from LEFT side to RIGHT side when face to the front (printed side) of transistor.

SAFETY PRECAUTIONS

NOTICE: Comply with all cautions and safety related notes located on or inside the cabinet and on the chassis or picture tube.

The following precautions should be observed.

1. Do not install, remove, or handle the picture tube in any manner unless shatterproof goggles are worn. People not so equipped should be kept away while picture tubes are handled. Keep picture tube away from the body while handling.
2. When replacing a chassis in the monitor, all the protective devices must be put back in place, such as barriers, non-metallic knobs, adjustment and compartment shields, and isolation resistor-capacitor, etc..
3. When service is required, observe the original lead dress. Extra precaution should be taken to assure correct lead dress in the high voltage circuitry area.
4. Always use the manufacturer's replacement components. Especially critical components as indicated on the Replacement parts list should not be replaced by other manufacturer's. Furthermore where a short circuit has occurred, replace those components that indicate evidence of overheating.
5. Before returning a serviced monitor to the customer, the service technician must thoroughly test the unit to be certain that it is completely safe to operate without danger of electrical shock, and be sure that no protective device built into the monitor by the manufacturer has become defective, or

inadvertently defeated during servicing. Therefore, the following checks should be performed for continued protection of the customer and service technician.

High Voltage

This monitor is provided with a high voltage hold down circuit for clearly indicating that voltage has increased in excess of a predetermined value. Comply with all notes described in this Service Manual regarding this hold down circuit when servicing, so that this hold down circuit may function correctly.

Service Warning

With minimum Brightness and Contrast the operation high voltage in this display is lower than 26KV.

If any component having influence on the high voltage is replaced, confirm that the high voltage with minimum Brightness and Contrast is lower than 26KV. To measure high voltage use a high impedance high-voltage meter. (SENSITIVE RESEARCH Model: ESH or Equivalent) Connect (-) to chassis earth and (+) to the CRT anode button. (See the following connection diagram Fig. 1).

NOTE:

- 1) Turn power switch off without fail before making the connection to the Anode button.
- 2) Before turn power switch ON, confirm the AC line voltage, set the "Voltage Selector".

Fig. 1

X-radiation

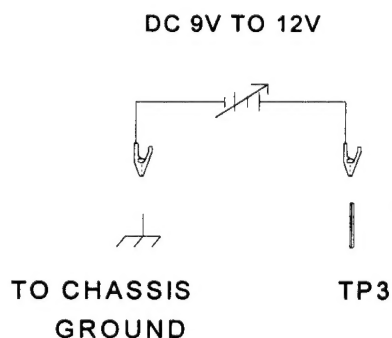

TUBE: The primary source of X-radiation in this monitor is the picture tube. The tube

utilized in this chassis is specially constructed to limit X-radiation emissions. For continued X-radiation protection, the replacement tube must be the same type as the original, manufacturer approved type. When troubleshooting and making test measurements in a monitor with a problem of excessive high voltage, avoid being unnecessarily close to the picture tube and the high voltage components. Do not operate the chassis longer than is necessary to locate the cause of excessive voltage.

CHECK OF HIGH VOLTAGE HOLD DOWN CIRCUIT

Checking of the high voltage hold down circuit operation.

1. Turn the switch of the unit ON.
2. Set Brightness, Contrast controls to max..
3. Check the voltage of TP3 is $8.0 \pm 0.5V$.
4. Turn off the unit and connect a DC power source to TP3 and chassis ground as shown in Fig. 2.

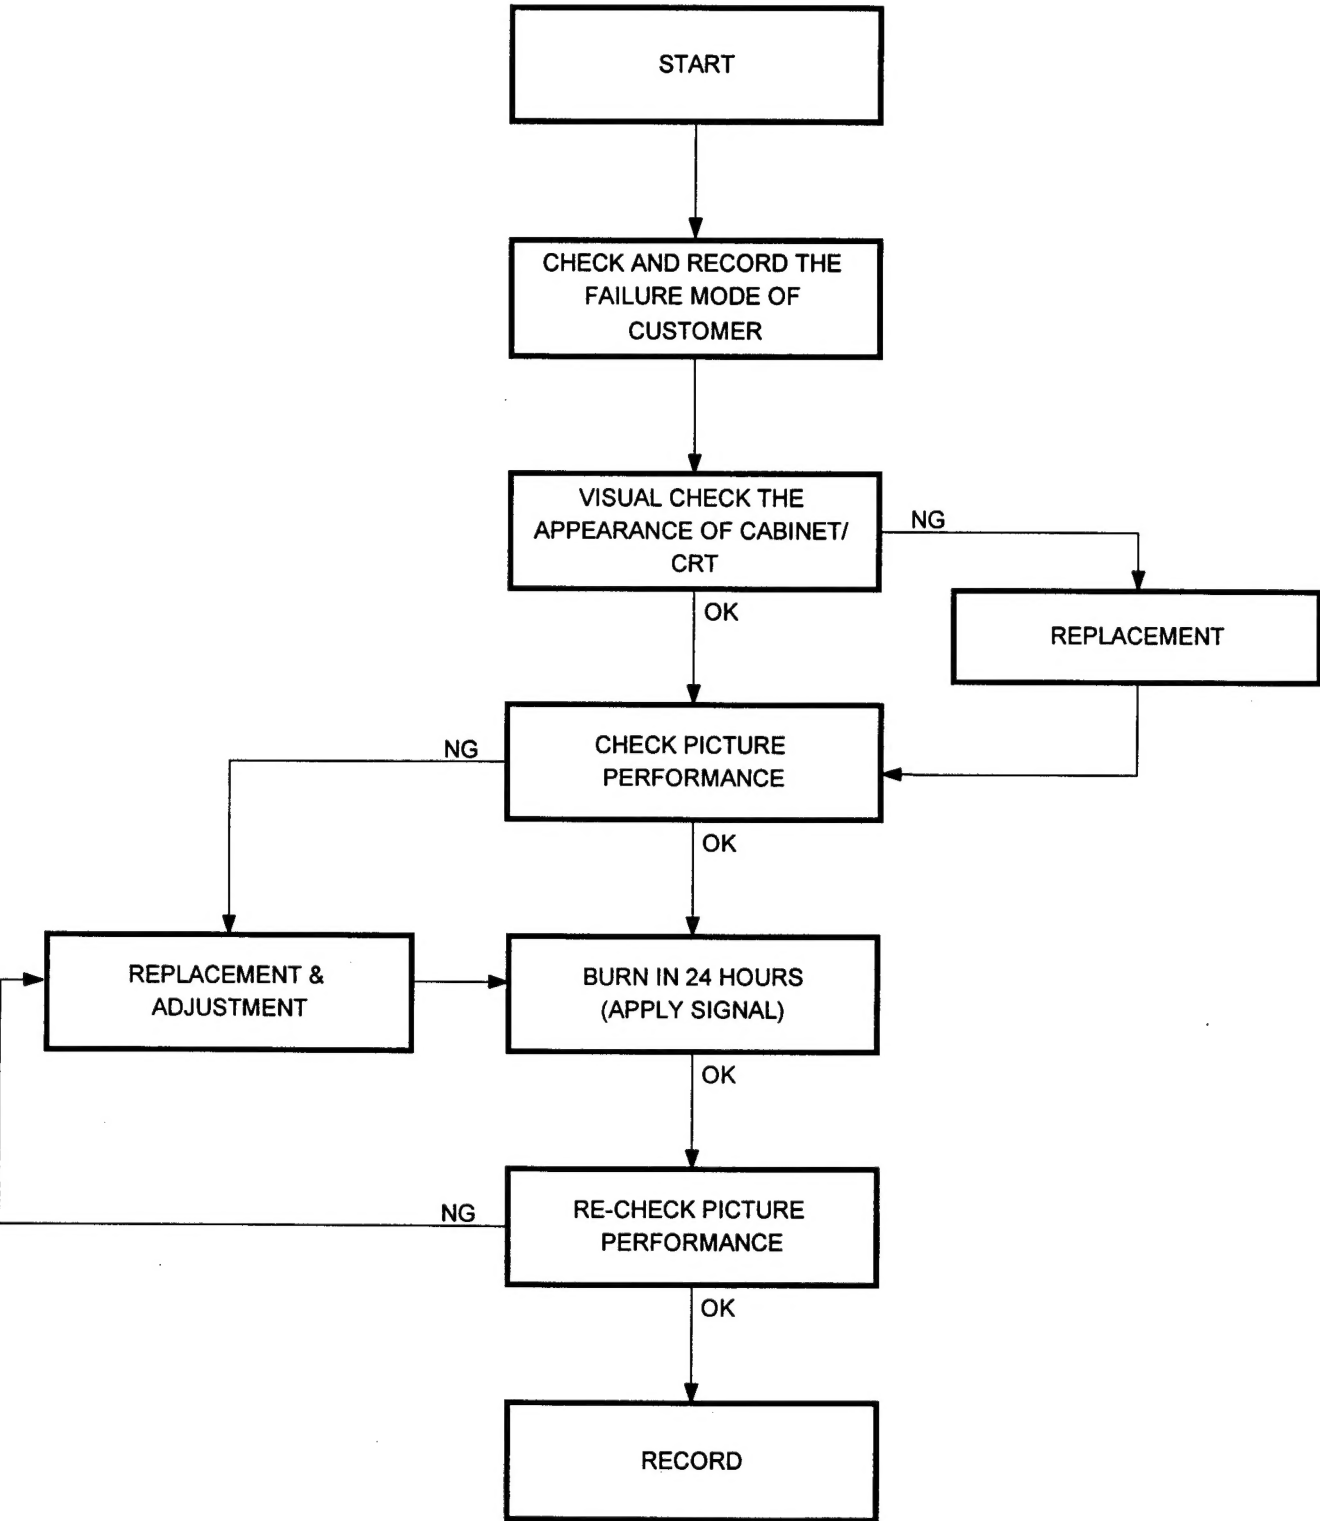

Main Board Assembly

Fig. 2

5. Turn the switch of the unit ON and turn on the DC power source.
6. Check the picture should disappear when the reading of DC power source is more than $9.2 \pm 0.5V$.
7. Turn the switch of the unit OFF immediately after the picture disappears.
8. Remove the DC power source.

2.0 GENERAL MAINTENANCE PROCEDURE

3.0 FUNCTION BLOCK DIAGRAM

4.0 DESCRIPTION OF CIRCUIT

1. Power supply circuit

The power supply is a "serial & universal AC input" switching power supply. The start up circuit will provide a DC voltage for PWM (Pulse Width Modulation) IC (IC101) when power on. When IC101 works normal start up circuit Q101 will cut off the DC voltage IC101 will auto-detect output voltage of V1 from pin2 and correct the duty cycle of pin6 output pulse to compensate the variation of output voltage.

The output of IC101 connected to power mosfet to drive the power transformer T101. When power mosfet is on, the energy stored in the primary winding of T101. Once mosfet is off, the energy transfer to the secondary and charges the output capacitor to get the stable DC voltage.

2. Oscillation circuit

Form Pin1~Pin13 of IC201 are for horizontal oscillation and Pin15~Pin19 are for vertical oscillation. The Pin2 is H-sync input, through Pin2 & 3 are for phase control, and then output to A.F.C (Auto Frequency Control). The H-phase from horizontal output circuit is sent to Pin4 for saw tooth generator. The Pin7 is A.F.C output connected to O.S.C control circuit to make the output frequency stable. The Pin12 is square wave output and connected horizontal output stage & H.V output stage Pin13 is X-RAY protect input. When H.V output circuit is abnormal (H.V too high), the X-RAY protect circuit will shut off the horizontal output, H.V. also will be shut down.

3. Horizontal output circuit

The H.V adjustment circuit consist of C703, Q709 and H.V regulation (Q711, Q712, Q713, Q714, IC701) which control the H.V output level. The duty cycle of Q709 gate directly control output voltage of C703. The C703 is a supply capacitor which supply the energy to primary winding of FBT and Q701 switch repeatedly to transfer the energy to FBT secondary winding.

4. Micon circuit

The IC501 (CPU) will detect polarity and frequency of input H.V Sync.. The CPU will determine the mode of input timing (preset or users mode) and load data from IC502 (E²PROM). The output of IC501 were connected the other function (ie. H-SIZE, V-SIZE, H-PHASE.....) Also, the user can adjust picture from keyboard and the data will be saved into IC502 automatically. For the O.S.D mode, when O.S.D manual is active CPU will inform the OSD IC to send O.S.D BLK signal to blank the video signal from VGA card and the IC603 (O.S.D IC) will send O.S.D R-G-B video signal the consist the O.S.D manual.

<u>IC501</u>	<u>Function control</u>
Pin1	H-phase
Pin3	Contrast
Pin17~19	H-linearity
Pin20,21	Power saving
Pin22	Degauss
Pin23	Mute
Pin32,33	H & V Sync output
Pin35	Parallel
Pin36	Keystone
Pin37	Side-pin
Pin38	V-position
Pin39,40	H & V Sync input

5. DC-DC convertor circuit

Due to output DC voltage is higher than input DC voltage we call the circuit step-up DC-DC regulator. The PWM control IC3843 is kernel of the circuit. The 3843 will detect the output of H-O/P and then change the duty of Pin6. When Q401 is on, the energy stored in the secondary of power transformer. The energy will be released and to get the B+ when Q401 turn off. So, the input duty cycle of Q401 gate is higher, the output B+ is higher.

6. Vertical output circuit

The vertical pulse from oscillation IC201 (LA7856) is sent to Pin2 of vertical IC (LA7838). The amplifier output Pin12 drives

the vertical deflection will directly. Voltage setting on Pin4 determines the peak level of the saw-tooth ramp, thus can be used as vertical height control. The DC feedback is sent to Pin7 of vertical IC (LA7838) adjusting VR801 can achieve best linearity.

7. Video output circuit

Video circuit consists of video preamplifier IC601 (M52737SP) and output cascode amplifier with RLC peripherals. IC601 is a Video processing IC equipped with three DC amplifiers to pre-amplify R.G.B signals from 0.6V to 3V. The voltage gain of these amplifiers are call DC controlled from Micro processor. The R.G.B GAIN & BIAS control signal are from DACs of OSD IC(STV9425). So simple voltage drive with resistors and timmers can be used to adjust the voltage GAIN and BIAS of each RGB signal's amplification and thus achieve a well balanced white picture.

The OSD IC is to control picture of OSD window. The video output stage contains three identical cascode amplifiers to amplify the video signal from IC601 to capable of driving CRT.

6.0 ADJUSTMENT

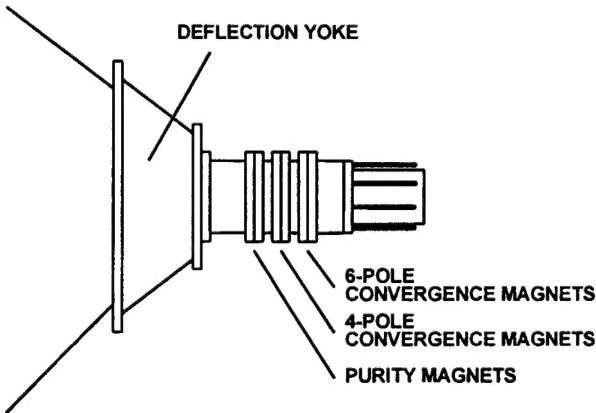

6.1 1569VL ADJUSTMENT

REM:PRESET MODE DATA ADJUSTMENT:

- Turn off it.
- Press the ⊕ and ⊖ at same time where on the external control panel.
- Turn on it.

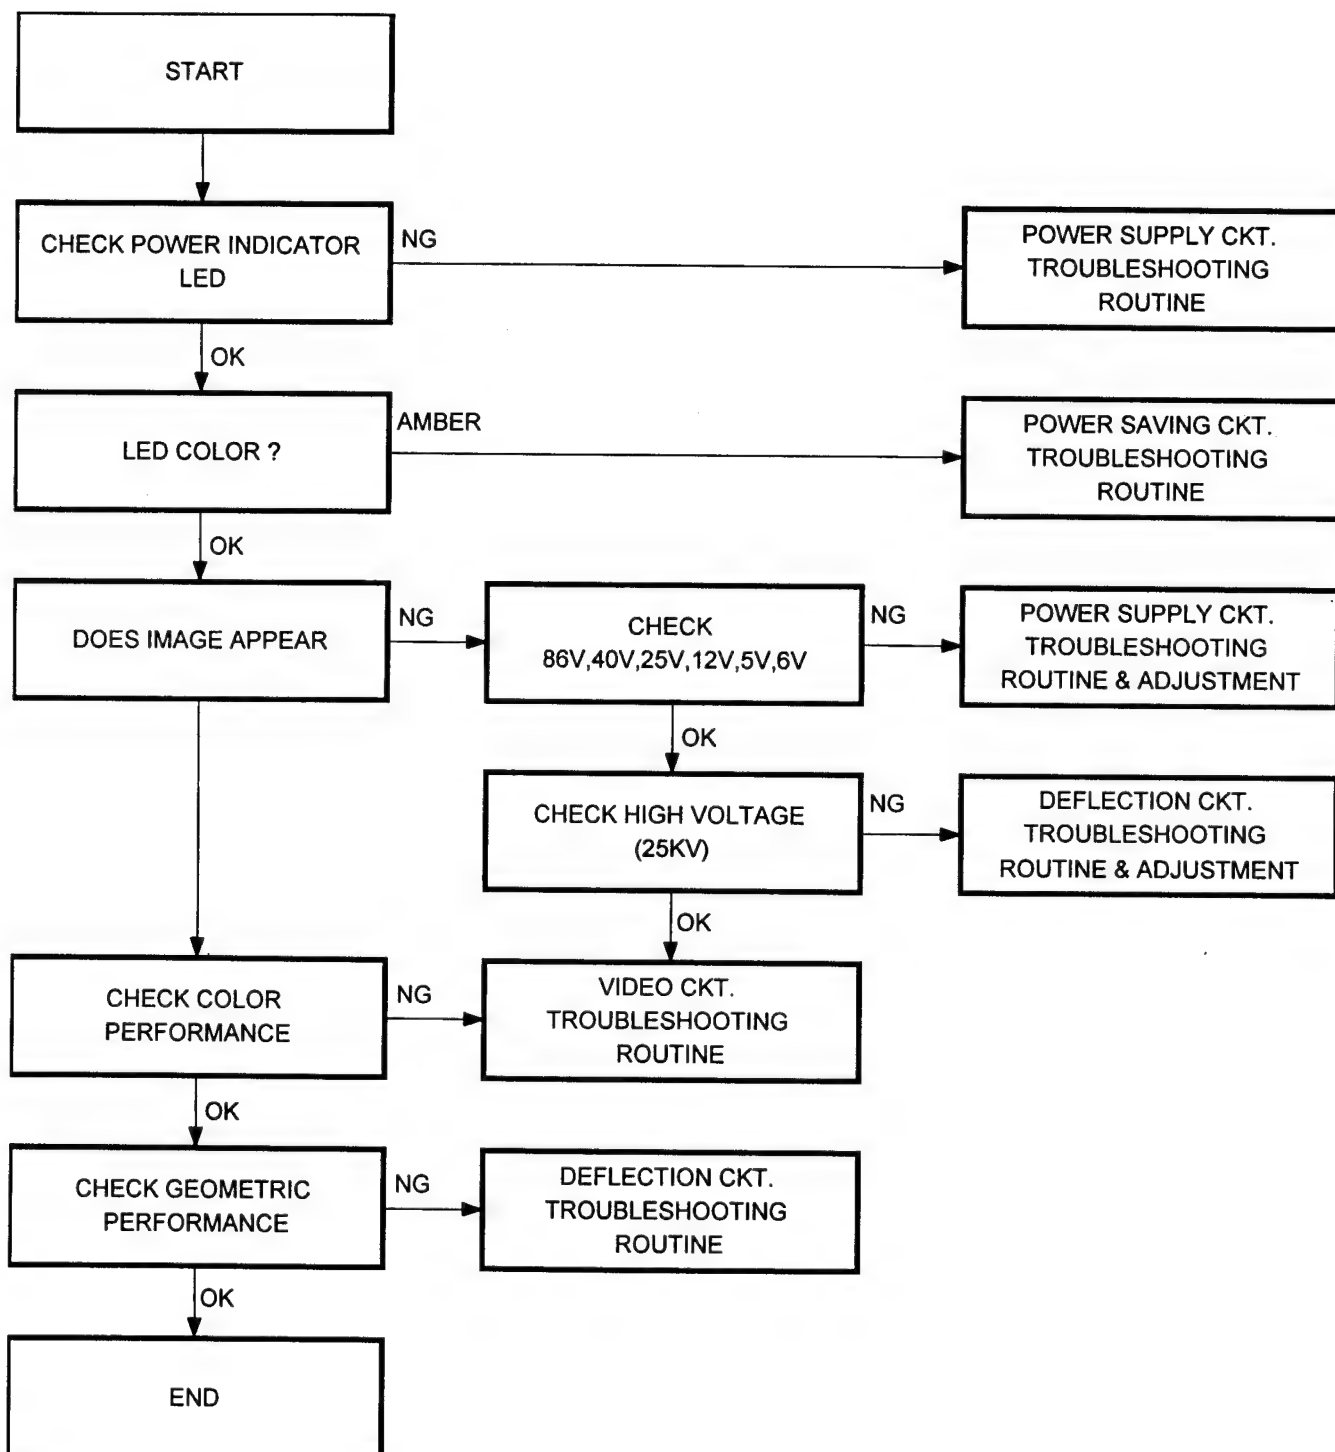

Remark: Before adjusting, monitor must warm up 10 minutes and CRT must be degaussed.

7.6 DEFLECTION CIRCUIT TROUBLESHOOTING ROUTINE

7.6.1 Horizontal Deflection Circuit

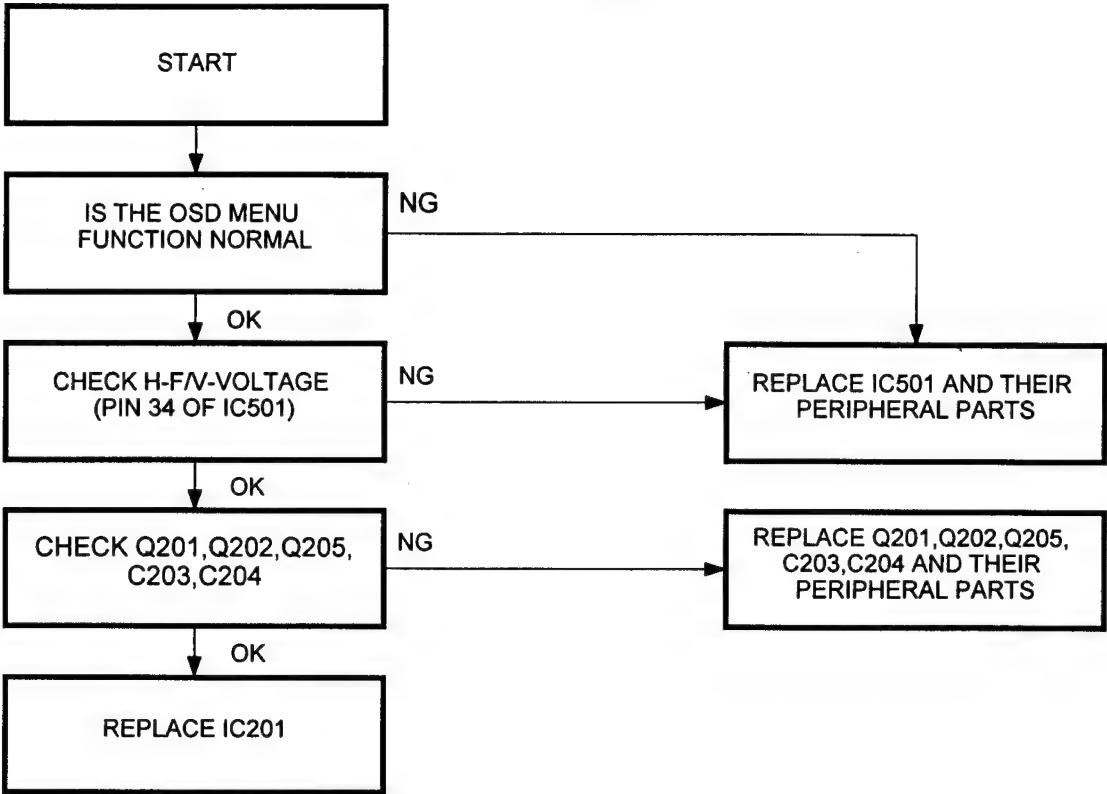

H-Asynchronous

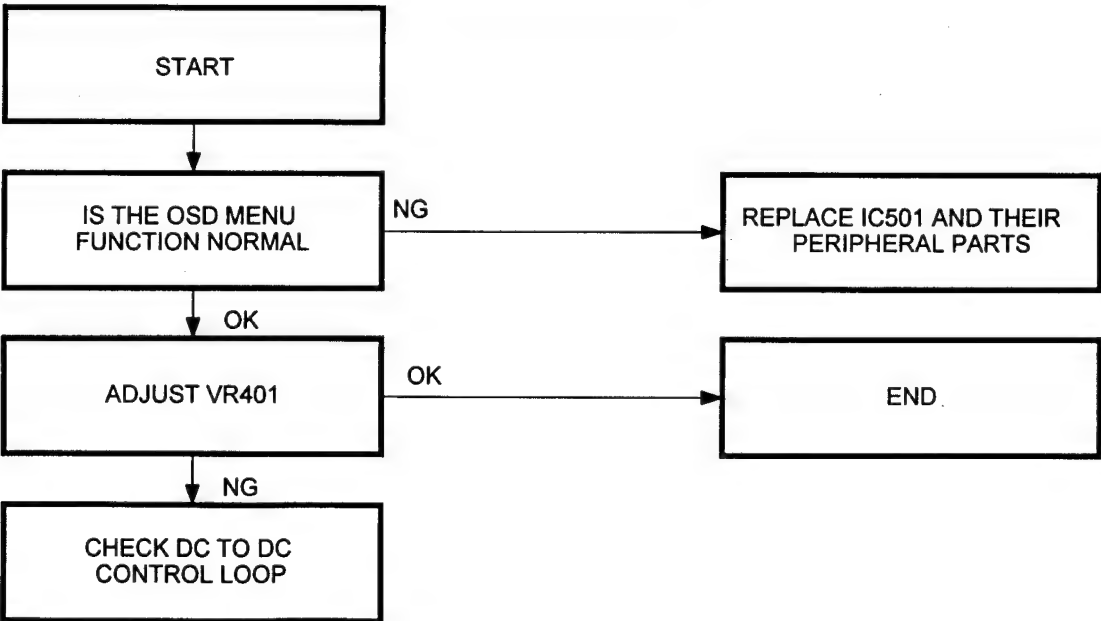

Linearity

REMARK: "L" means the voltage between gate and source is $<4V$ which can't turn on the MOSFET.
 "H" means the voltage between gate and source is $\geq 4V$ which can turn on the MOSFET.

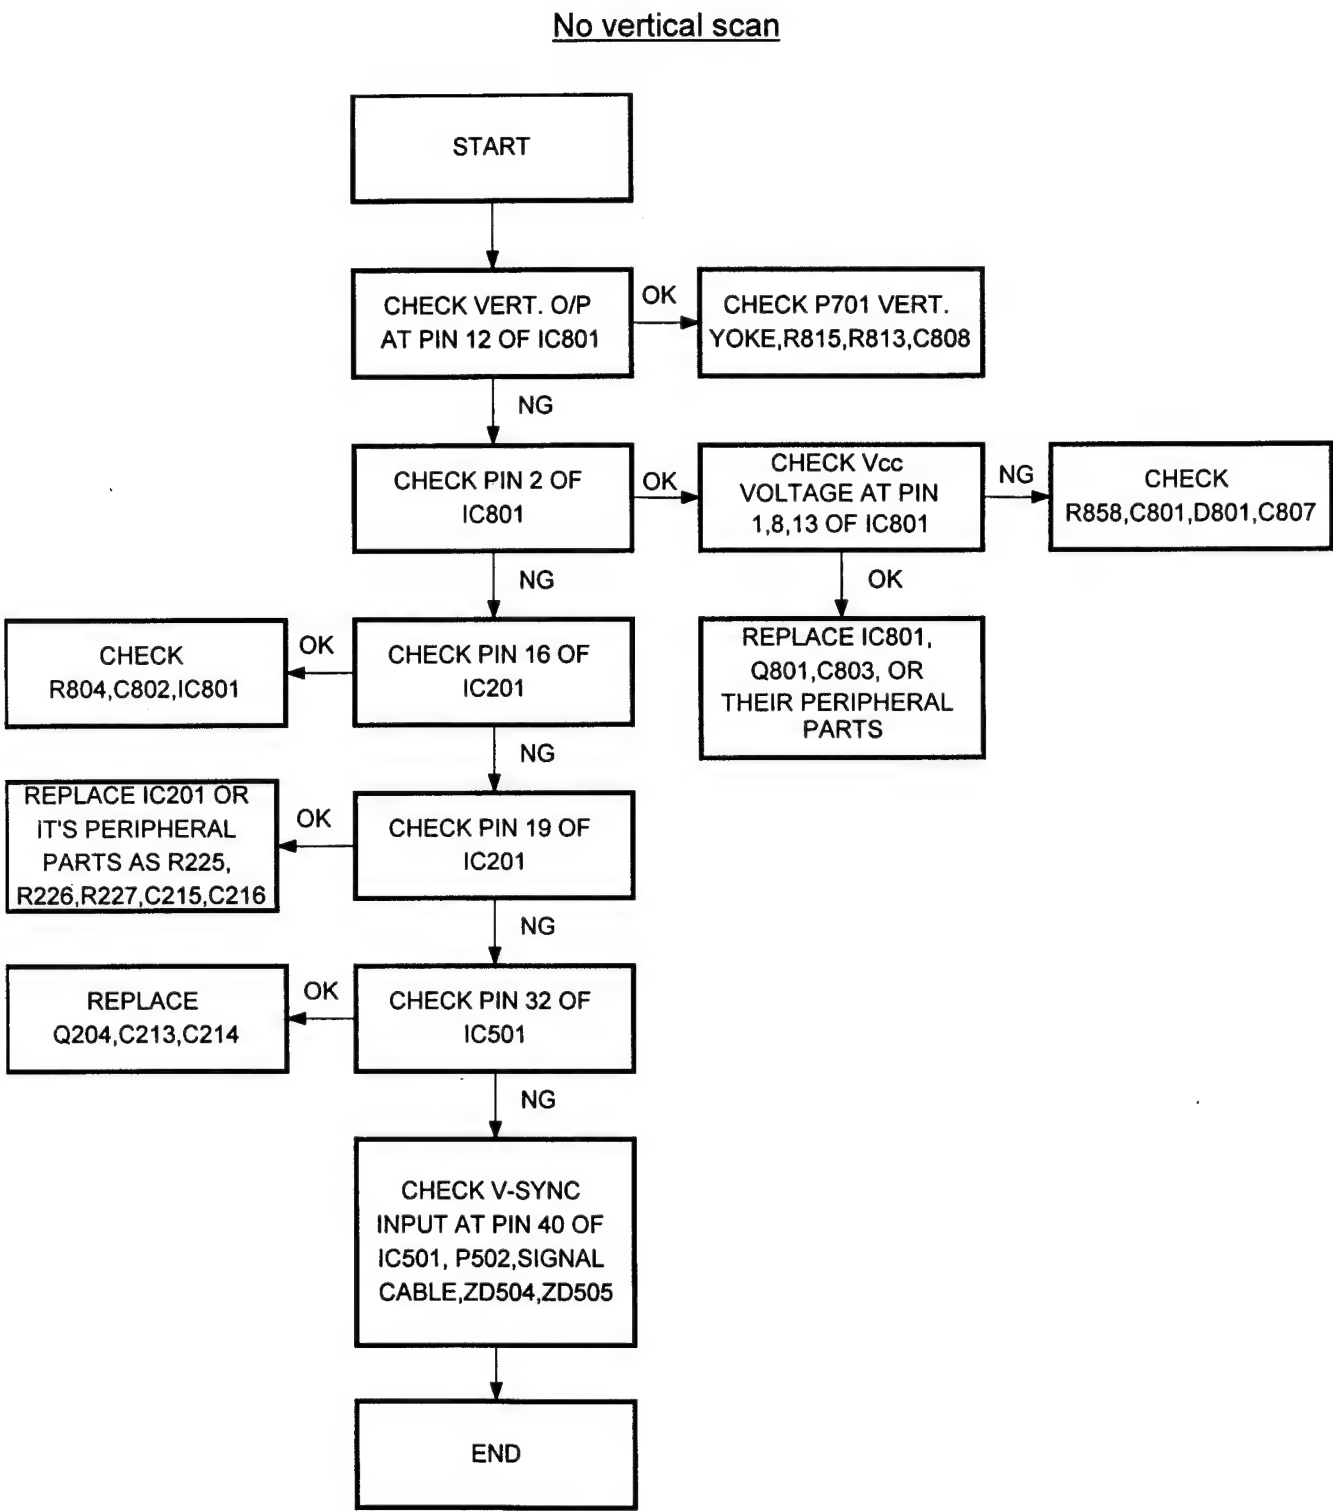

Out of phase

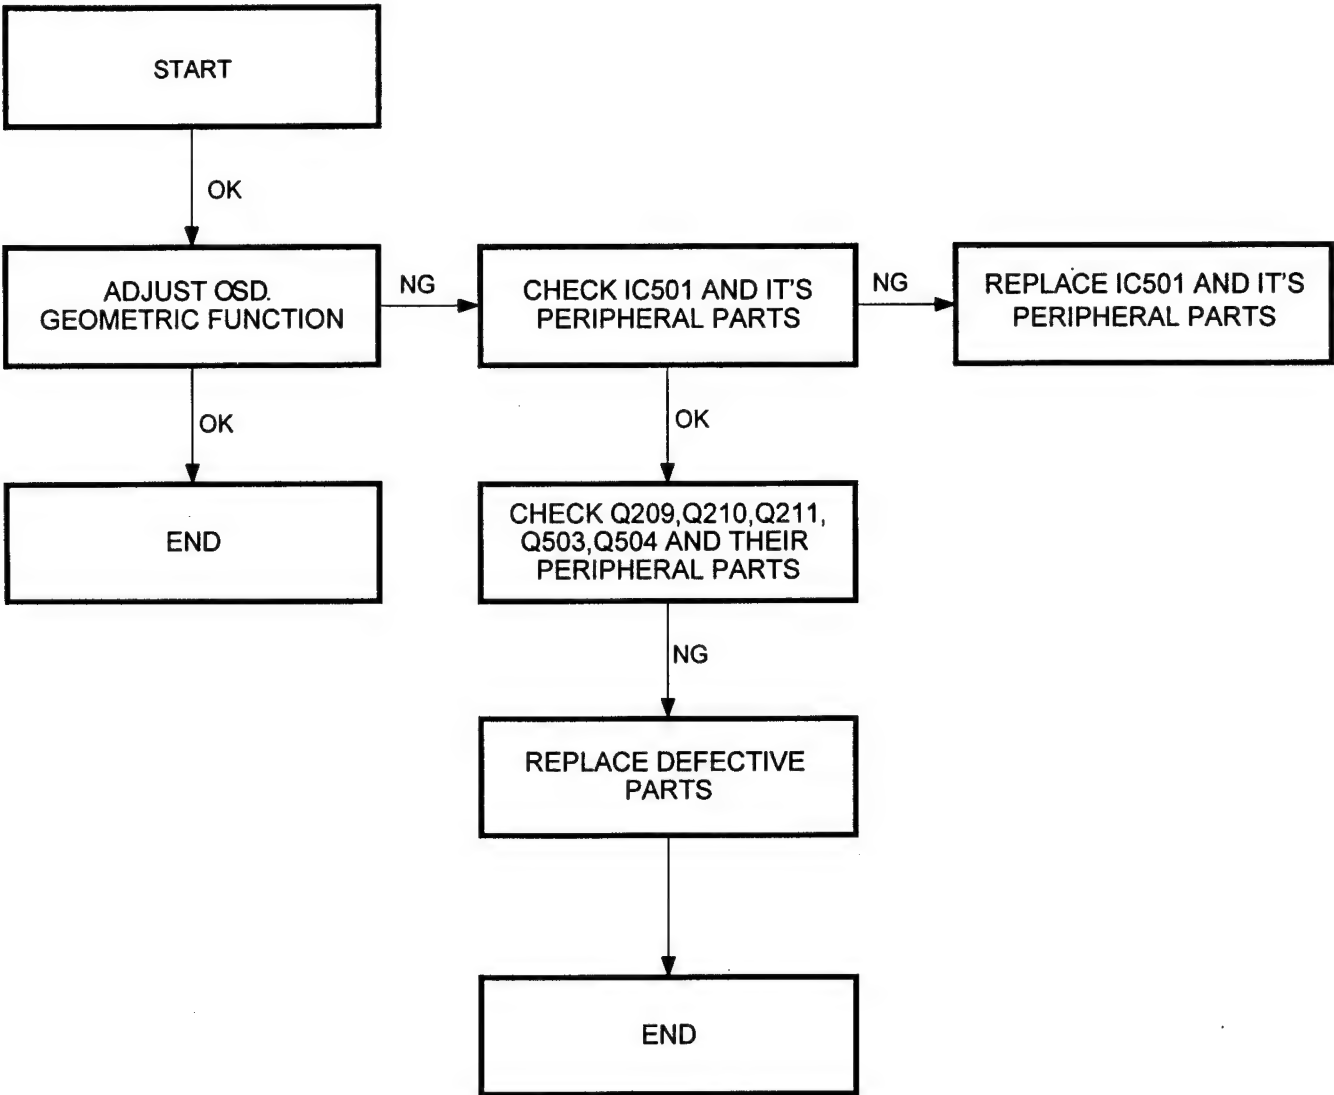

Width Abnormal

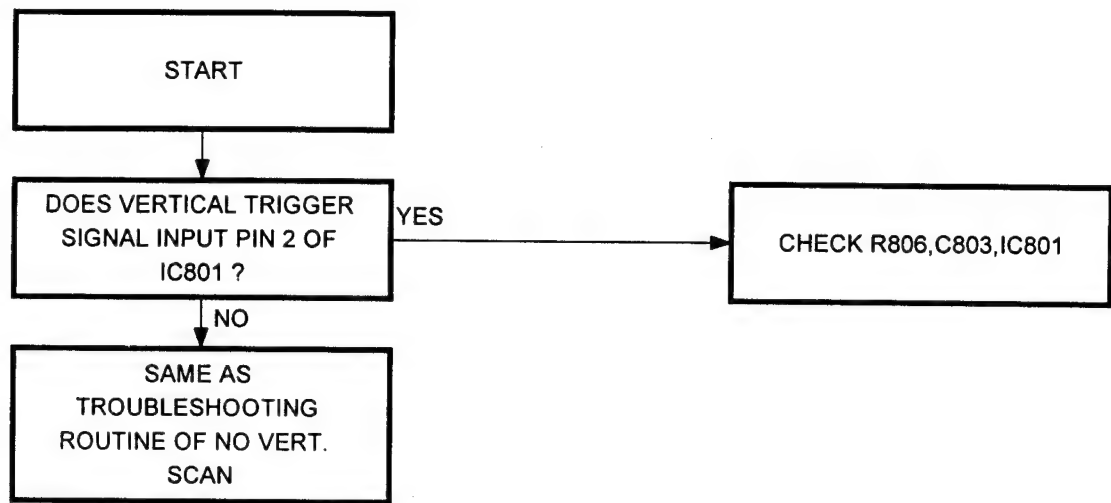

7.6.2 Vertical Deflection Circuit

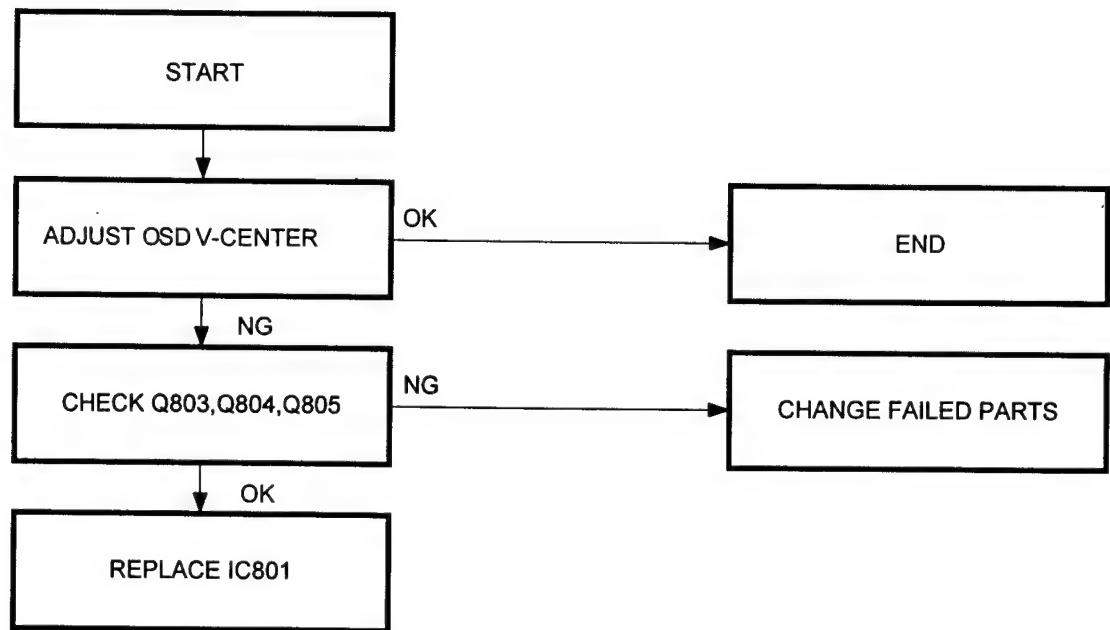

Picture distortion

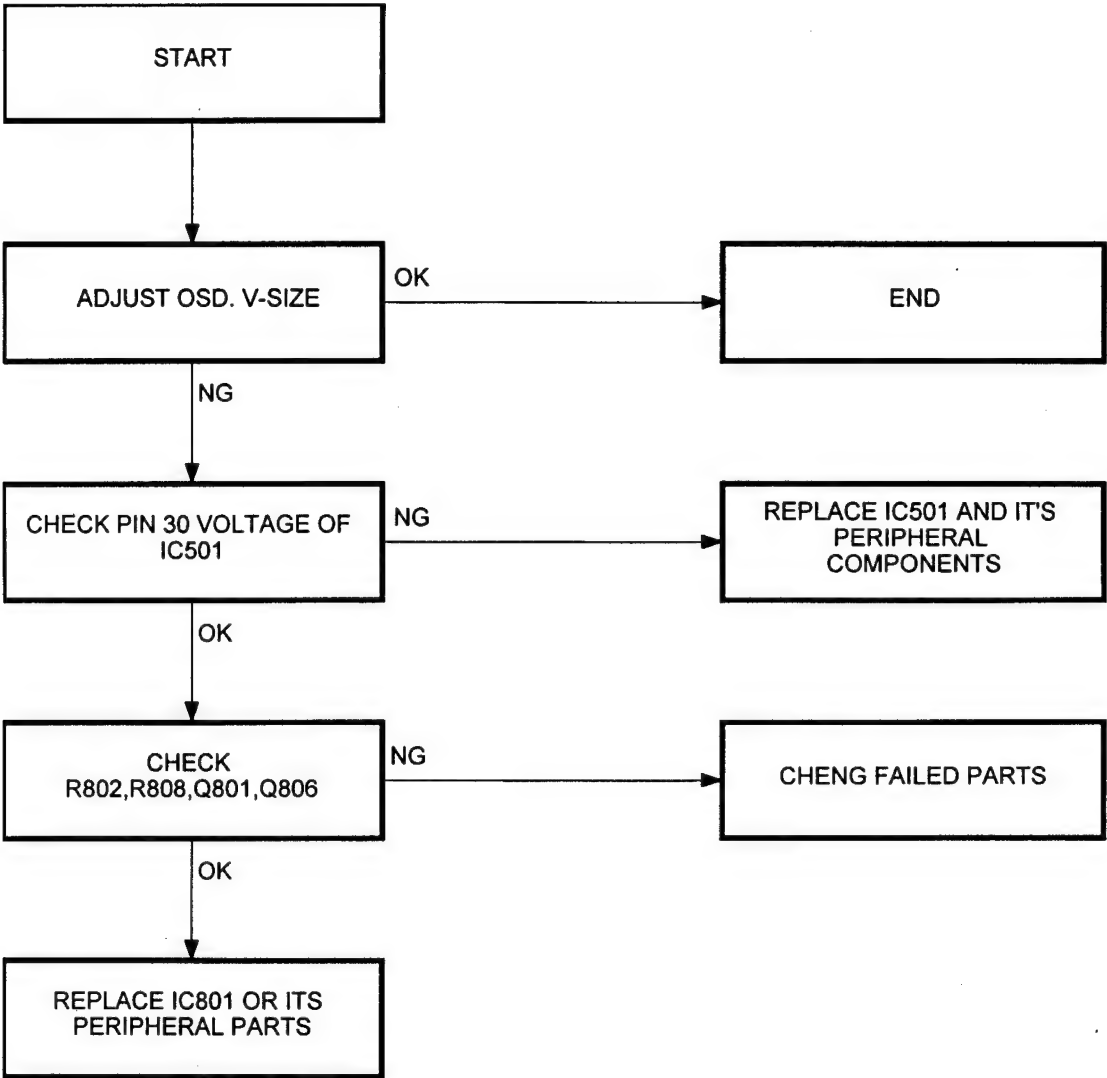

V-Asynchronous

Vertical position

Vertical Size

The following voltage records were measured with cross-hatch pattern.

Transistor Unit:: volt

9.0 PARTS LIST

1569VL Parts List

Abbreviations : Capacitors

EL: Electrolytic Aluminum, TA: Tantalum, CE: Ceramic

PP: Polypropylene, PEI: Polyster (Inductive),

PEN: Polyster (Non-Inductive) PPS: Serial Poly Propylene,

MPE: Polyster Metalized, MPP: Polypropylene Metalized.

Resistors

CF: Carbon Film, MF: Metal Film, VR: Variable Resistor.

MOF: Metal Oxide Film, POT: Potentiometer

Semiconductor TR: Transistor, DI: Diode, ZD: Zener Diode, IC: IC.

Remark:

●: 1st priority , Recommended Q'ty = (Location Number x3)

⊙: 2nd priority, Recommended Q'ty = (Location Number x2)

N : New parts

! : Critical components Affecting X-radiation
